In "Stereotype Threat Effects on Older Adults' Episodic and Working Memory: A Meta-Analysis," DOI: 10.1093/geront/gnx056, there was an error in the results section of the abstract. The correct results section is below.

"Results:

Analyses revealed a reliable effect of ST on both older adults' episodic ($d = 0.253$) and working memory performance ($d = 0.373$). Interestingly, the age-based ST effect was only significant when blatant ST manipulations were used

with episodic memory tasks or when subtle ST manipulations were used with working memory tasks. Moreover, within episodic memory, the ST effect only reached significance for recall but not cued-recall or recognition performance, and for immediate but not delayed tests of memory. Neither age nor level of education moderated the association between ST and older adults' memory performance."

This has now been corrected in the original article.
