## Rydell et al. (2009)

## EPPI-Centre (2003) & Critical Appraisal Skills Programme (2018)

If the study has a broad focus and this data extraction focuses on just one component of the study, please specify this here
$\hfill\square$ Not applicable (whole study is focus of data extraction)
$\boxtimes$ Specific focus of this data extraction (please specify)
• Only Experiment 3 tests working memory capacity directly.
Study aim(s) and rationale
Was the study informed by, or linked to, an existing body of empirical and/or theoretical research?
Please write in authors' declaration if there is one. Elaborate if necessary, but indicate which aspects are reviewers' interpretation.
$\boxtimes$ Explicitly stated (please specify)
$\Box$ Implicit (please specify)
$\square$ Not stated/unclear (please specify)
• social identity and stereotype threat
• stereotype threat and identity identification
• effects of stereotype threat on working memory
Do authors report how the study was funded?
$\boxtimes$ Explicitly stated (please specify)

☐ Implicit (please specify)

 $\square$  Not stated/unclear (please specify)

This research was supported by National Science Foundation (NSF) Grant BCS 0601148, Institute of Education Sciences Grant R305H050004, NSF CAREER Grant DRL-0746970, and by the Lewis Endowed Professorship.

#### Study research question(s) and its policy or practice focus

#### What is/are the topic focus/foci of the study?

- We sought to document how the availability of multiple social identities impacts the cognitive substrates governing maths problem solving.
- In the present experiment, we examined whether those in the mulitple-identities condition, who receive both college student and gender stereotypes, might not experience the compromises of working memory typically observed when women's gender stereotypes are available.

### What is/are the population focus/foci of the study?

• women under stereotype threat

What is the relevant age group?	
$\square$ Not applicate (focus not learners)	
□ 0 - 4	
□ 5 - 10	
□ 11 - 16	
□ 17 - 20	
$\square$ 21 and over	
$\boxtimes$ Not stated/unclear	
What is the sex of the population focus/foci?	,
$\square$ Not applicate (focus not learners)	
⊠ Female only	
□ Male only	
$\square$ Mixed sex	
□ Not stated/unclear	

## What is/are the educational setting(s) of the study?

☐ Community centre
☐ Correctional institution
☐ Government department
$\square$ Higher education institution
$\square$ Home
$\Box$ Independent school
$\Box$ Local education authority
□ Nursery school
$\Box$ Other early years setting
$\hfill\Box$ Post-compulsory education institution
☐ Primary school
☐ Residential school
☐ Secondary school
☐ Special needs school
☐ Workplace
$\Box$ Other educational setting
In Which country or cuntries was the study carried out?
$\boxtimes$ Explicitly stated (please specify)
$\hfill\Box$ Not stated/unclear (please specify)
• United States

Please describe in more detail the specific phenomena, factors, services, or interventions with which the study is concerned

#### What are the study reserach questions and/or hypotheses?

Research questions or hypotheses operationalise the aims of the study. Please write in authors' description if there is one. Elaborate if necessary, but indicate which aspects are reviewers' interpretation.

$\boxtimes$	Explicitly stated (please specify)
	Implicit (please specify)
	Not stated/unclear (please specify)

We expected that participants in the gender identity condition would show poorer working memory capacity presumably because of intrusive thoughts and verbal ruminations associated with being under stereotype threat, which, in turn, would impair maths performance

In this condition, gender identity should be accessible (see Experiment 2) as well as the imbalance between concepts of self, group, and ability domain.

However, we expected participants in the multiple-identities condition, because of their greater identification with being a college students, would show no relative decrements in working memory capacity because the accessibility of the college student identity would presumably reduce intrusive thoughts and worries about the stereotype that women are bad at maths.

This should result in consonance between propositions about the self, group, and ability domain, and thus maths performance should not suffer.

Those in the control condition and in the college identity condition are also expected to show relatively better maths performance than the gender identity condition (replacing Experiment 1 and 2) and not reveal compromised working memory capacity because gender stereotyepes were not made salient to them.

#### Methods - Design

Which variables or concepts, if any, does the study aim to measure or examine?

$\boxtimes$	Explicitly stated (please specify)
	Implicit (please specify)
	Not stated/unclear (please specify)
•	Working memory task

• maths performance

#### Study timing

Please indicate all that apply and give further details where possible.

If the study examines one or more samples, but each at only one point in time it is cross-sectional.

If the study examines the same samples, but as they have changed over time, it is retrospective, provided that the interest is in starting at one timepoint and looking backwards over time. If the study examines the same samples as they have changed over time and if data are collected forward over time, it is prospective provided that the interest is in starting at one timepoint and looking forward in time.

$\boxtimes$ Cross-sectional
$\square$ Retrospective
□ Prospective
$\square$ Not stated/unclear (please specify)
If the study is an evaluation, when were measurements of the $variable(s)$ used for outcome made, in relation to the intervention?
If at least one of the outcome variables is measured both before and after the intervention, please use the before and after category.
$\square$ Not applicable (not an evaluation)
$\square$ Before and after
$\square$ Only after
$\Box$ Other (please specify)
$\hfill\Box$ Not stated/unclear (please specify)
Methods - Groups
If comparisons are being made between two or more groups, please specify the basis of any divisions made for making these comparisons.
Please give further details where possible.
$\square$ Not applicable (not more than one group)
$\boxtimes$ Prospecitive allocation into more than one group (e.g. allocation to different interventions, or allocation to intervention and control groups)

	No prospective allocation but use of pre-existing differences to create comparison groups (e.g. receiving different interventions, or characterised by different levels of a variable such as social class)
	Other (please specify)
	Not stated/unclear (please specify)
Hou	do the groups differ?
	Not applicable (not more than one group)
	Explicitlyly stated (please specify)
	Implicit (please specify)
	Not stated/unclear (please specify)
•	2 (college student stereotype: absent vs present) x $2$ (gender stereotype: absent vs present) between-subjects factorial design.
Nun	nber of groups
	For instance, in studies in which comparisons are made between groups, this may be umber of groups into which the dataset is divided for analysis (e.g. social class, or form, or the number of groups allocated to, or receiving, an intervention.
	Not applicable (not more than one group)
	One
	Two
	Three
$\boxtimes$	Four or more (please specify)
	Other/unclear (please specify)
Was	$the\ assignment\ of\ participants\ to\ interventions\ randomised?$
	Not applicable (not more than one group)
	Not applicate (no prospective allocation)
	Random

□ Quasi-random
□ Non-random
$\square$ Not stated/unclear (please specify)
Where there was prospective allocation to more than one group, was the allocation sequence concealed from participants and those enrolling them until after enrolment?
Bias can be introduced, consciously or otherwise, if the allocation of pupils or classes or schools to a programme or intervention is made in the knowledge of key characteristics of those allocated. For example: children with more serious reading difficulty might be seen as in greater need and might be more likely to be allocated to the 'new' programme, or the opposite might happen. Either would introduce bias.
$\square$ Not applicable (not more than one group)
$\square$ Not applicable (no prospective allocation)
⊠ Yes (please specify)
$\square$ No (please specify)
$\square$ Not stated/unclear (please specify)
Apart from the experimental intervention, did each study group receive the same level of care (that is, were they treated equally)?
<ul><li>✓ Yes</li><li>☐ No</li><li>☐ Can't tell</li></ul>
Study docian cummany

#### Study design summary

In addition to answering the questions in this section, describe the study design in your own words. You may want to draw upon and elaborate the answers you have already given.

- 1. seated at a computer in a private room
- 2. received instructions to manipulate the availability of stereotypes for college students and women regarding maths performance
- 3. completed a working memory task
- 4. difficult maths problems

## Methods - Sampling strategy

Are the authors trying to produce findings that are representative of a given population?

Please write in authors' description. If authors do not specify please indicate reviewers' interpretation.  Explicitly stated (please specify)  Implicit (please specify)  Not stated/unclear (please specify)  Which methods does the study use to identify people or groups of people to sample from and what is the sampling frame?  e.g. telephone directory, electoral register, postcode, school listing, etc. There may be two stages — e.g. first sampling schools and then classes or pupils within them.  Not applicable (please specify)  Explicitly stated (please specify)  Implicit (please specify)  Not stated/unclear (please specify)  University  Which methods does the study use to select people or groups of people (from the sampling frame)?  e.g. selecting people at random, systematically - selecting for example every 5t person, purposively in order to reach a quota for a given characteristic. Please provide details including names for all tools used to collect data and examples of any questions/items given. Also please state whether source is cited in the report.
<ul> <li>☑ Explicitly stated (please specify)</li> <li>☐ Implicit (please specify)</li> <li>☐ Not stated/unclear (please specify)</li> </ul>
Working memory: - shorted version of the verbal ("vowel counting") task used by Schmader and Johns (2003; modelled after Turner & Engle, 1989)
$\it Maths\ problem$ : - 10 maths problems, selected from the 15 used in Experiment 1) - Maths problems in Experiment 1 modelled after those used on standardized tests, and used in past stereotype threat research (Schmader & Johns, 2003)
Who collected the data?
Please indicate all that apply and give further detail where possible.
□ Researcher □ Head teacher/Senior management □ Teaching or other staff □ Parents □ Pupils/students □ Governors □ LEA/Government officials □ Other education practitioner □ Other (please specify) □ Not stated/unclear
$Do\ the\ authors\ describe\ any\ ways\ they\ addressed\ the\ reliability\ of\ their\ data\ collection\ tools/methods?$
$e.g.\ test\text{-}retest\ methods\ (Where\ more\ than\ one\ tool\ was\ employed\ please\ provide\ details\ for\ each.)$
□ Details
Do the authors describe any ways they have addressed the validity of their data collection tools/methods?
e.g. mention previous validation of tools, published version of tools, involvement of target population in development of tools. (Where more than one tool was employed please provide details for each.)
□ Details

# Was there concealment of study allocation or other key factors from those carrying out measurement of outcome – if relevant?

Not applicable – e.g. analysis of existing data, qualitative study. No – e.g. assessment of reading progress for dyslexic pupils done by teacher who provided intervention. Yes – e.g. researcher assessing pupil knowledge of drugs - unaware of pupil allocation.
<ul> <li>□ Not applicable (please say why)</li> <li>□ Yes (please specify)</li> <li>□ No (please specify)</li> </ul>
Where were the data collected?
e.g. school, home.
<ul> <li>□ Explicitly stated (please specify)</li> <li>□ Implicit (please specify)</li> <li>□ Unclear/not stated (please specify)</li> </ul>
Are there other important features of data collection?
e.g. use of video or audio tape; ethical issues such as confidentiality etc.
$\square$ Details
Methods - Data analysis
Which methods were used to analyse the data?
Please give details e.g. for in-depth interviews, how were the data handled? Details of statistical analysis can be given next.
<ul> <li>⊠ Explicitly stated (please specify)</li> <li>□ Implicit (please specify)</li> <li>□ Not stated/unclear (please specify)</li> </ul>
Which statistical methods, if any, were used in the analysis?
□ Details
$\it Maths\ performance$ : - ANOVA on the number of maths problems answered correctly - Simple effects analyses

Working memory capacity: - The number of words correctly recalled on the working memory task in a 2 x 2 ANOVA - Simple effects analyses - Examined the accuracy of vowel counting in a 2 x 2 ANOVA

 $\label{eq:mediational analyses: -multiple regression analyses to examine the mediational role of working memory capacity for the relation between the college student and gender stereotypes interaction and maths performance - the conditions necessary to conduct mediational analyses were met - Sobel test$ 

What rationale do the authors give for the methods of analysis for the study?
e.g. for their methods of sampling, data collection, or analysis.
$\square$ Details
For evaluation studies that use prospective allocation, please specify the basis on which data analysis was carried out.
'Intention to intervene' means that data were analysed on the basis of the original number of participants as recruited into the different groups. 'Intervention received' means data were analysed on the basis of the number of participants actually receiving the intervention.
<ul> <li>□ Not applicable (not an evaluation study with prospective allocation)</li> <li>□ 'Intention to intervene'</li> <li>□ 'Intervention received'</li> <li>□ Not stated/unclear (please specify)</li> </ul>
$Do\ the\ authors\ describe\ any\ ways\ they\ have\ addressed\ the\ reliability\ of\ data$ analysis?
e.g. using more than one researcher to analyse data, looking for negative cases.
$\square$ Details
Do the authors describe any ways they have addressed the validity of data analysis?
e.g. internal or external consistency; checking results with participants.
$\square$ Details
Do the authors describe strategies used in the analysis to control for bias from confounding variables?
$\square$ Details
Please describe any other important features of the analysis.
$\square$ Details
Please comment on any other analytic or statistical issues if relevant.
$\square$ Details
Results and Conclusions
How are the results of the study presented?
e.g. as quotations/figures within text, in tables, appendices.
$\square$ Details

- in text
- table
- figure

#### What are the results of the study as reported by authors?

Please give details and refer to page numbers in the report(s) of the study where necessary (e.g. for key tables).

#### $\square$ Details

Maths performance: - ANOVA revealed the anticipated two-way interaction - Simple effects analyses revealed that when participants were not given gender stereotypes, performance was equally strong regardless of the presentation of college student stereotypes. - When participants were given the gender stereotype, those who received college student stereotypes performed better than those who did not receive college student stereotypes - Consistent with Experiments 1 - 2, maths performance in the gender identity condition was significantly poorer than in the three other conditions, which did not differ from one another.

Working memory capacity: - ANOVA revealed a significant interaction - Simple effects analyses showed that when participants were not given gender stereotypes, working memory capacity (as assessed by the number of words recalled) did not differ as a function of the presentation of college student stereotypes - When given gender stereotypes, those who did not receive college student stereotypes (i.e., multiple-identities condition) recalled fewer words than those who received college student stereotypes (i.e., gender identity condition) - Working memory capacity in the gender identity condition was significantly lower than in the three other conditions, which did not differ from one another. - Thus, the condition in which the poorest maths problem performance was produces (i.e., the gender identity condition) was also the condition in which the lowest working memory capacity was revealed as assessed by the word recall analyses. - We also examined hte accuracy of vowel counting in a 2 x 2 ANOVA, which revealed no significant effects.

Mediational analyses: - The independent variable (i.e., the interaction between college student and gender stereotype manipulations) mad a unique contribution in predicting the dependent variable (i.e., maths performance) when the main effect of college student and gender stereotypes were included in the regression equation - Also, the independent variable (the interaction term) made a unique contribution in predicting the mediator variable (i.e., working memory capacity) when the main effects of positive and negative stereotypic information were statistically controlled - In addition, the mediator variable also predicted the dependent variable - Thus, participants had their maths performance simultaneously regressed on the manipulation of college student stereotypes, the manipulation of gender stereotypes, the interaction of these manipulations, and on working memory capacity. - This multiple regression revealed that when working memory capacity was included, the relation between the interaction of college student and gender stereotypes and maths performance was no longer significant. - A Sobel test demonstrated that working memory capacity accounted for a significant amount of variance in the relation between maths performance

and the interaction between college student and gender stereotypes - Thus, working memory full mediated the relation between maths performance and the interaction between college student and gender stereotypes.

Was the precision of the estimate of the intervention or treatment effect reported?

• CONSIDER:
- Were confidence intervals (CIs) reported?
$\square$ Yes
⊠ No
$\Box$ Can't tell
Are there any obvious shortcomings in the reporting of the data?
$\square$ Yes (please specify) $\boxtimes$ No
Do the authors report on all variables they aimed to study as specified in their aims/research questions?
This excludes variables just used to describe the sample.
☐ Yes (please specify)
□ No
Do the authors state where the full original data are stored?
☐ Yes (please specify)
⊠ No
What do the $author(s)$ conclude about the findings of the $study$ ?

Please give details and refer to page numbers in the report of the study where necessary.

□ Details

Experiment 3 further elucidated the processes by which the availability of a social identity associated with positive stereotypes eradicates the impact of a social identity associated with a negative stereotype. Concurrently providing women with two applicable social identities, one associated with positive stereotypes in a performance domain (i.e., college students are good at maths) and one associated with negative stereotypes in a performance domain (i.e., women are bad at maths; the typical condition that evokes stereotype threat), once again eliminated the averse impact on performance typically seen in stereotype threat research.

Specifically, when the social identity available to these women was associated with a negative performances stereotype, their working memory capacity was compromised, and performance suffered. However, the availability of an additional identity associated with positive performance did not lead to working memory depletion, and accordingly, performance did not suffer despite the fact that one's gender was also highlighted. Thus, Experiments 2

and 3 show the processes, both in terms of social identity accessibility and working memory capacity through which stereotype threat for women in a maths task can be eliminated by introducing an additional social identity associated with a positive performance.

#### Quality of the study - Reporting

#### Is the context of the study adequately described?

Consider your answer to questions: Why was this study done at this point in time, in those contexts and with those people or institutions? (Section B question 2) Was the study informed by or linked to an existing body of empirical and/or theoretical research? (Section B question 3) Which of the following groups were consulted in working out the aims to be addressed in the study? (Section B question 4) Do the authors report how the study was funded? (Section B question 5) When was the study carried out? (Section B question 6)

$\boxtimes$	Yes	(please	specify)
П	No (	please	specify)

### Are the aims of the study clearly reported?

Consider your answer to questions: What are the broad aims of the study? (Section B question 1) What are the study research questions and/or hypotheses? (Section C question 10)

$\boxtimes$	Yes (please specify	-)
	No (please specify)	)

# Is there an adequate description of the sample used in the study and how the sample was identified and recruited?

Consider your answer to all questions in Methods on 'Sampling Strategy', 'Recruitment and Consent', and 'Actual Sample'.

$\boxtimes$	Yes (please specify)
	No (please specify)

## Is there an adequate description of the methods used in the study to collect data?

Consider your answer to the following questions in Section I: Which methods were used to collect the data? Details of data collection methods or tools Who collected the data? Do the authors describe the setting where the data were collected? Are there other important features of the data collection procedures?

$\boxtimes$	Yes (please specify)
	No (please specify)

#### Is there an adequate description of the methods of data analysis?

Consider your answer to the following questions in Section J: Which methods were used to analyse the data? What statistical methods, if any, were used in the analysis? Who carried out the data analysis?

<ul><li>✓ Yes (please specify)</li><li>✓ No (please specify)</li></ul>
Is the study replicable from this report?
<ul><li>✓ Yes (please specify)</li><li>☐ No (please specify)</li></ul>
Do the authors avoid selective reporting bias?
(e.g. do they report on all variables they aimed to study as specified in their $aims/research\ questions?)$
<ul><li>✓ Yes (please specify)</li><li>☐ No (please specify)</li></ul>
Quality of the study - Methods and data
Are there ethical concerns about the way the study was done?
Consider consent, funding, privacy, etc.
$\boxtimes$ Yes, some concerns (please specify)
$\square$ No concerns
• consent was not mentioned.
Were students and/or parents appropriately involved in the design or conduct of the study?
<ul> <li>✓ Yes, a lot (please specify)</li> <li>☐ Yes, a little (please specify)</li> <li>☐ No (please specify)</li> </ul>
Is there sufficient justification for why the study was done the way it was?
<ul><li>✓ Yes (please specify)</li><li>☐ No (please specify)</li></ul>
Was the choice of research design appropriate for addressing the research $question(s)$ posed?
<ul><li>✓ Yes (please specify)</li><li>✓ No (please specify)</li></ul>
To what extent are the research design and methods employed able to rule out

To what extent are the research design and methods employed able to rule out any other sources of error/bias which would lead to alternative explanations for the findings of the study?

e.g. (1) In an evaluation, was the process by which participants were allocated to or otherwise received the factor being evaluated concealed and not predictable in advance? If not, were sufficient substitute procedures employed with adequate rigour to rule out any

alternative explanations of the findings which arise as a result? e.g. (2) Was the attrition rate low and if applicable similar between different groups?
<ul> <li>□ A lot (please specify)</li> <li>⋈ A little (please specify)</li> <li>□ Not at all (please specify)</li> </ul>
How generalisable are the study results?
$\square$ Details
• very for women under maths stereotype threat
Weight of evidence - A: Taking account of all quality assessment issues, can the study findings be trusted in answering the study question(s)?
In some studies it is difficult to distinguish between the findings of the study and the conclusions. In those cases please code the trustworthiness of this combined results/conclusion. Please remember to complete the weight of evidence questions B-D which are in your review specific data extraction guidelines.
<ul> <li>⊠ High trustworthiness (please specify)</li> <li>□ Medium trustworthiness (please specify)</li> <li>□ Low trustworthiness (please specify)</li> </ul>
Have sufficient attempts been made to justify the conclusions drawn from the findings so that the conclusions are trustworthy?
<ul> <li>□ Not applicable (results and conclusions inseparable)</li> <li>□ High trustworthiness</li> <li>□ Medium trustworthiness</li> <li>□ Low trustworthiness</li> </ul>
Wolls et al. (2014)

#### CASE CONTROL STUDIES

**Note:** A study can be awarded a maximum of one star for each numbered item within the Selection and Exposure categories. A maximum of two stars can be given for Comparability.

#### Selection

### Is the case definition adequate?

- a) yes, with independent validation
- b) yes, e.g., record linkage or based on self reports
- c) no description

#### Representativeness of the cases

- a) consecutive or obviously representative series of cases \*
- b) potential for selection biases or not stated

#### Selection of Controls

- a) community controls \*
- b) hospital controls
- c) no description

#### Definition of Controls

- a) no history of disease (endpoint) \*
- b) no description of source

#### Comparability

#### Comparability of cases and controls on the basis of the design or analysis

- a) study controls for \_\_\_\_\_ (Select the most important factor.)
- b) study controls for any additional factor \* (This criterion could be modified to indicate specific control for a second important factor.)

#### Exposure

#### Ascertainment of exposure

- a) secure record (e.g., surgical records) \*
- b) structured interview where blind to case/control status \*
- c) interview not blinded to case/control status
- d) written self report or medical record only
- e) no description

#### Same method of ascertainment for cases and controls

- a) yes \*
- b) no

#### Non-Response rate

- a) same rate for both groups \*
- b) non respondents described
- c) rate different and no designation

#### COHORT STUDIES

**Note:** A study can be awarded a maximum of one star for each numbered item within the Selection and Outcome categories. A maximum of two stars can be given for Comparability.

#### Selection

#### Representativeness of the exposed cohort

- a) truly representative of the average \_\_\_\_\_ (describe) in the community \*
- b) somewhat representative of the average \_\_\_\_\_ in the community
- c) selected group of users, e.g., nurses, volunteers
- d) no description of the derivation of the cohort

#### Selection of the non exposed cohort

- a) drawn from the same community as the exposed cohort \*
- b) drawn from a different source
- c) no description of the derivation of the non exposed cohort

#### Ascertainment of exposure

- a) secure record (e.g., surgical records) \*
- b) structured interview \*
- c) written self report
- d) no description

#### Demonstration that outcome of interest was not present at start of study

- a) yes \*
- b) no

#### Comparability

#### Comparability of cohorts on the basis of the design or analysis

- a) study controls for \_\_\_\_\_ (select the most important factor) \*
- b) study controls for any additional factor \* (This criterion could be modified to indicate specific control for a second important factor.)

#### Outcome

#### Assessment of outcome

- a) independent blind assessment \*
- b) record linkage \*
- c) self report
- d) no description

#### Was follow-up long enough for outcomes to occur

- a) yes (select an adequate follow up period for outcome of interest) \*
- b) no

Adequacy of follow up of cohorts
<ul> <li>a) complete follow up - all subjects accounted for *</li> <li>b) subjects lost to follow up unlikely to introduce bias - small number lost - &gt;</li></ul>
University of Glasgow (n.d.)
DOES THIS REVIEW ADDRESS A CLEAR QUESTION?
Did the review address a clearly focussed issue?
<ul> <li>Was there enough information on: <ul> <li>The population studied</li> <li>The intervention given</li> <li>The outcomes considered</li> </ul> </li> <li>Yes</li> <ul> <li>Can't tell</li> <li>No</li> </ul> </ul>
Did the authors look for the appropriate sort of papers?
<ul> <li>The 'best sort of studies' would: <ul> <li>Address the review's question</li> <li>Have an appropriate study design</li> </ul> </li> <li>Yes</li> <ul> <li>Can't tell</li> <li>No</li> </ul> </ul>
ARE THE RESULTS OF THIS REVIEW VALID?
Do you think the important, relevant studies were included?
<ul> <li>Look for: <ul> <li>Which bibliographic databases were used</li> <li>Follow up from reference lists</li> <li>Personal contact with experts</li> <li>Search for unpublished as well as published studies</li> <li>Search for non-English language studies</li> </ul> </li> <li>Yes</li> <li>Can't tell</li> <li>No</li> </ul>

### 

•	The authors need to consider the rigour of the studies they have identified.	Lack of
	rigour may affect the studies results.	

 $\square$  Yes

□ Can't tell □ No	
If the results of the review have been combined, was it reasonable	to do so?
<ul> <li>Consider whether: <ul> <li>The results were similar from study to study</li> <li>The results of all the included studies are clearly displayed</li> <li>The results of the different studies are similar</li> <li>The reasons for any variations are discussed</li> </ul> </li> <li>Yes</li> <li>Can't tell</li> <li>No</li> </ul>	
WHAT ARE THE RESULTS?	
What is the overall result of the review?	
<ul> <li>Consider:</li> <li>If you are clear about the review's 'bottom line' results</li> <li>What these are (numerically if appropriate)</li> <li>How were the results expressed (NNT, odds ratio, etc)</li> </ul>	
How precise are the results?	
<ul> <li>Are the results presented with confidence intervals?</li> <li>☐ Yes</li> <li>☐ Can't tell</li> <li>☐ No</li> </ul>	
WILL THE RESULTS HELP LOCALLY?	
Can the results be applied to the local population?	
<ul> <li>Consider whether: <ul> <li>The patients covered by the review could be sufficiently differ population to cause concern</li> <li>Your local setting is likely to differ much from that of the review</li> </ul> </li> <li>Yes</li> <li>Can't tell</li> <li>No</li> </ul>	-
Were all important outcomes considered?	
□ Yes □ Can't tell □ No	

#### Are the benefits worth the harms and costs?

•	Even if this	is not	addressed	by the	review,	what	do yo	ou thi	nk?
	Yes								
	Can't tell								
	No
